Eric S. Lander is the founding Director of the newly created Broad Institute, a partnership among MIT, Harvard University, and affiliated hospitals aimed at realizing the promise of the human genome for medicine. He is also a Member of the Whitehead Institute and Professor of biology at MIT.

He is one of the driving forces behind today’s revolution in genomics, the study of all of the genes in an organism and how they function together in health and disease. He has been one of the principal leaders of the Human Genome Project. Under Lander’s leadership, the Whitehead Center for Genome Research has been responsible for developing most of the key tools of modern mammalian genomics.

About the Lecture Series

The Distinguished Lecture Series of the Program for Evolutionary Dynamics is designed to provide scientific leaders with the opportunity to address innovative interdisciplinary research interests in a public forum with a general scientific audience.
